

Dear IBM Hiring Team,

I am applying for the Salesforce & GTM Developer Intern position for September 2026. I am a third-year Computer Science Co-op student at the University of Ottawa, and this role is a strong match for both my technical background and the direction I want to grow in.

The most relevant thing on my resume for this role is SalesRadar, a B2B account intelligence platform I built that integrates directly with Salesforce via OAuth 2.0 REST API. I designed the full integration layer: authenticating with Salesforce, mapping Watson NLU entity extraction to Salesforce Lead fields, and enabling one-click export of scored accounts with the full intelligence report attached. Building that gave me a concrete understanding of how Salesforce works as a data platform and how external systems connect to it through its API surface. I am familiar with REST-based Salesforce integrations and comfortable working within its object model.

Beyond the Salesforce work, I have solid fundamentals in JavaScript, HTML, CSS, and REST API design through projects like FilmGrid, a full-stack React and Node.js application, and Court Vision, a data engineering pipeline built on PostgreSQL with a live-connected Tableau BI layer. I use Git daily and am comfortable across the full development lifecycle from scoping and design through testing and deployment.

I researched IBM's Salesforce practice before applying and I am genuinely interested in the consulting side of this role, specifically the challenge of translating business requirements into technical solutions on a platform that non-technical stakeholders interact with directly. That translation problem is something I find interesting and have some experience with.

I would welcome the opportunity to contribute to IBM's Salesforce team and learn from experienced developers and consultants doing this work at scale.

Thank you for your consideration.

Sincerely,

Zain Rizvi
