

Dear TD Hiring Team,

I am applying for the Wealth Gen AI Product & Enablement Intern/Co-op position for Fall 2026. I am a third-year Computer Science Co-op student at the University of Ottawa with experience building AI-powered applications and data pipelines, and this role caught my attention because it sits right at the intersection of generative AI and real financial services impact.

The project I keep coming back to when thinking about this role is SalesRadar, a B2B account intelligence platform I built that runs real-time news through IBM Watson NLU to extract buying signals and score purchase intent on a 0 to 100 scale. The interesting part was not just connecting an AI model, but making its outputs actually useful: surfacing per-signal evidence, tiering accounts by priority, and enabling one-click Salesforce CRM export via OAuth 2.0. That focus on taking AI output and turning it into something people can act on is what I understand Gen AI enablement to be about.

On the data and analytics side, I built dashboards in ServiceNow, Excel, and Power BI at York Region tracking 500+ monthly IT incidents across a team of 10+ technicians, with findings that directly shaped infrastructure decisions. More recently I designed and deployed Court Vision, an end-to-end NBA analytics pipeline on PostgreSQL and Supabase with a live Tableau BI layer. Both projects pushed me to think carefully about how data gets from raw input to something a stakeholder can actually use.

I am genuinely excited about TD because of the scale at which these problems exist in financial services and the seriousness with which the organization is approaching Gen AI. I would love the chance to contribute to that.

Thank you for your time and consideration.

Sincerely,

Zain Rizvi
